Jean-Baptiste Lamarck (1744-1829) : *Philosophie zoologique* (1809)  
 Lamarck's theory of evolution is based on the idea of "use and disuse".  
 He proposed that organisms change over time due to the use or disuse of their organs.  
 For example, he suggested that giraffes developed long necks because they stretched their necks to reach higher leaves.  
 Lamarck's theory was one of the first to propose that species are not fixed but can change over time.  
 However, it was later found that Lamarck's mechanism of inheritance (the inheritance of acquired characteristics) is incorrect.  
 Despite this, Lamarck's work was an important step in the development of evolutionary biology.
